

Technical Competence May

This month involves a lot of training in different technologies. This earned the company a lot of valuable certifications so that they may utilize and partner with other companies. While doing the training, I noticed it also improved my technical competence, now being able to apply system comprehension of technologies to study specific products much more quickly.

Some of the technology I studied this month are New Relic, D'Link, and Veeam. All of these are different branches of technology, but because I have already gotten a lot of system comprehension from studying at BINUS, I can quickly deduct what each of these technologies do, and understand their specifics without having to relearn the basics, thus increasing my technical application skills.
