

Technical Competence April

I have done a lot of client work and learning new IT technologies over the past month. With the activities I do teaching me new things as well as putting things I already know how to do into practice. During office hours, when I don't have a specific task, I put an effort to learn new skills that relates to my job as well as my education and even personal hobbies in certain cases. I watch a lot of YouTube videos relating to the topics surrounding my work, and that has helped me grow in my technical competences.

During April, I have worked together with the same client on their project. I have made progress in maintaining and working with their routers. I worked on mostly Mikrotik routers, utilizing my system application and system comprehension skills on the client's Mikrotik routers, which was difficult because they utilized a much older version of the routers and refused to update them. Overall, this helped me build more technical competence by building up my logic and experience working with these types of technology.
